The Challenges of Nursing Stroke Management in Rehabilitation Centres Bianca Buijck 2019-01-26 This volume provides integral knowledge of all aspects of stroke care and rehabilitation after stroke, and is therefore highly relevant for nurses who work in rehabilitation centers. It outlines the several phases after stroke, for example the type of care patients may receive in the chronically phase at home. Nurses will obtain knowledge about treatment, importance of observation and caring with a special focus on communication problems, swallowing problems, activities of daily living, urinary and defecation problems, shoulder and hand issues. Thanks to photographs, nurses will learn to transfer patients in the adequate positions. Several chapters provide nurses with examples of effective and efficient collaboration with multidisciplinary professionals, informal caregivers and patients themselves. There is also an emphasis on behavior and cognitive functioning. And lastly, in the final chapters authors highlight the organization of rehabilitation and integrated care issues. Nurses play a very important role in rehabilitation, education, counseling, prevention, and caring for patients with cerebrovascular accident (CVA). In caring for stroke patients, nurses need specific competences and abilities that go beyond the general neurologic knowledge and experience. Nurses need to collaborate in an efficient and effective manner with multidisciplinary team members in their organization and across organizations. This book discusses medical aspects and specific symptoms of a stroke, as well as the limitations that patients experience, and which interventions are indicated for recovery.

The Effectiveness of an In-patient Management Program for Hemiplegic Shoulder Pain During Rehabilitation and at Six-month Follow-up Louise Gustafsson 2005

Progress of Passive Shoulder Range of Motion in the First Month of Hemiplegia Robert W. Sandstrom 1986

Exercise Therapy for Recovery from Hemiplegia Kazumi Kawahira 2022-11-14 This book introduces an innovative, efficient, and patient-friendly neural net constructive therapy for patients with mild to severe hemiplegia, not only in the recovery phase but also in acute and chronic phases. The explanations are supported by extensive photographs of each position and a set of 72 video clips to help readers follow and reproduce the techniques. This book explains the theory of Repetitive Facilitative Exercise (RFE), which is a combination of repetitive volitional flexion and extension movements from neurofacilitation approaches. This exercise is aimed at achieving the intended movements and lessening synergistic movement patterns by reconstructing and strengthening the neuropathways of the injured nerve tract. Instead of interpreting disorders based on reflex theory and constructing treatment methods, the new approach considers scientific treatment methods that emphasize the formation of neural pathways by improving synapse formation and transmission efficiency based on functional localization, central programs, and neural nets. Chapters provide a basic theory of RFE, offering the underlying mechanisms of nerve tract formation/strengthening, such as functional localization, voluntary movement, plasticity, and neural lateral sprouting, giving readers a comprehensive understanding of the prompt and repetitive therapy. This is followed by an exposition of practice and techniques, planning of treatment programs, and facilitation techniques for voluntary movements of the upper limb, individual fingers, and lower limb. Finally, the book introduces RFE to facilitate and enhance motor skills in walking and other functions. Exercise Therapy for Recovery from Hemiplegia - Theory and Practice of Repetitive Facilitative Exercise will provide

rehabilitation therapists, physiotherapists, occupational therapists, and medical doctors a refreshing alternative theory and practice to current approaches. Neuroscience researchers, stroke patients, and their families would find this book informative.

Brain Repair After Stroke Steven C. Cramer 2010-10-28 Increasing evidence identifies the possibility of restoring function to the damaged brain via exogenous therapies. One major target for these advances is stroke, where most patients can be left with significant disability. Treatments have the potential to improve the victim's quality of life significantly and reduce the time and expense of rehabilitation. Brain Repair After Stroke reviews the biology of spontaneous brain repair after stroke in animal models and in humans. Detailed chapters cover the many forms of therapy being explored to promote brain repair and consider clinical trial issues in this context. This book provides a summary of the neurobiology of innate and treatment-induced repair mechanisms after hypoxia and reviews the state of the art for human therapeutics in relation to promoting behavioral recovery after stroke. Essential reading for stroke physicians, neurologists, rehabilitation physicians and neuropsychologists.

HEMIPLEGIC SHOULDER PAIN AFTER RECENT STROKE (SPARS): IS CLINICAL FRAILTY RELATED TO PAIN OUTCOME? (NCT 02574000) Martine Nadler 2017 BackgroundShoulder weakness within 72 hours post-stroke significantly increases the risk of hemiplegic shoulder pain outcome at two months (Nadler 2017). Here we investigated whether patient frailty using the Clinical Frailty Score (CFS) was associated with pain outcome.MethodsRetrospective analysis of consecutive, unselected stroke patients assessed within 72 hours and followed-up for shoulder pain (standardised pain questionnaire) and muscle power (MRC). Pre-admission CFS and Modified Rankin Score (mRS) were noted. Patients were classified as u201cFrailu201d; CFS u22654 or u201cNot-frailu201d; CFS u22643. Pain outcome was dichotomised into u201cgoodu201d if there was never pain or any pain had resolved at follow-up or u201cpooru201d if pain developed/remained at two months.Results121 patients had initial and follow-up data. 30/121 were Frail aged 76.1 +/- 11.6 years (score 3-6) and 91/121 were Not-frail aged 66.9 +/- 12.9 years. The Frail group was significantly older (p= 0.0006 ANOVA). Pain outcome was not associated with frailty (p>0.05 Chi Squared test) nor age (p>0.05). Shoulder muscle weakness (MRC

Evidence-Based Interventional Pain Medicine Jan Van Zundert 2011-10-19 Unrelieved chronic pain is a worldwide epidemic Chronic pain has been subject to multiple international initiatives through the World Health Organization. Interventional Pain Medicine, the use of minimally invasive techniques to relieve pain, is the best approach when simpler measures such as physical therapy or medications fail. However, these procedures can be associated with significant risk and expense. Establishing uniformity in diagnostic criteria and procedural performance can reduce both morbidity and unnecessary procedures, and hence healthcare expenditures. While other texts explain how to perform these procedures, little focus has been

given to diagnostic considerations: if and when these procedures should be performed. Evidence-Based Interventional Pain Medicine focuses on a balance between effectiveness and safety of interventional management for specific diagnoses, across all areas of chronic pain including: Head, neck and shoulder pain Lower back pain Neuropathic pain syndromes Complex Regional Pain Syndrome Pain in patients with cancer Vascular and visceral pain Evidence-Based Interventional Pain Medicine provides essential knowledge for anyone who uses, or intends to use, interventional pain techniques.

Physical Therapy of the Shoulder Robert Donatelli 1987

Occupational Therapy and the Patient With Pain Florence S Cromwell 2014-05-22 This volume speaks to the issue of occupational therapy practice with the patient in pain. The hows and whys of treatment are explored in a broad range of chapters written by and for professionals in the field of occupational therapy. *Stroke Rehabilitation* Richard Wilson 2018-09-12 Practical and concise, *Stroke Rehabilitation* provides everyday clinical guidance on current methods, techniques, evidence, and controversies in this important area. This focused resource by Drs. Richard Wilson and Preeti Raghavan consolidates today's available information in an easy-to-navigate format for today's practicing and trainee physiatrists, as well as other members of the rehabilitation team.

Clinical Pathways in Stroke Rehabilitation Thomas Platz 2021-01-14 This open access book focuses on practical clinical problems that are frequently encountered in stroke rehabilitation. Consequences of diseases, e.g. impairments and activity limitations, are addressed in rehabilitation with the overall goal to reduce disability and promote participation. Based on the available best external evidence, clinical pathways are described for stroke rehabilitation bridging the gap between clinical evidence and clinical decision-making. The clinical pathways answer the questions which rehabilitation treatment options are beneficial to overcome specific impairment constellations and activity limitations and are well acceptable to stroke survivors, as well as when and in which settings to provide rehabilitation over the course of recovery post stroke. Each chapter starts with a description of the clinical problem encountered. This is followed by a systematic, but concise review of the evidence (RCTs, systematic reviews and meta-analyses) that is relevant for clinical decision-making, and comments on assessment, therapy (training, technology, medication), and the use of technical aids as appropriate. Based on these summaries, clinical algorithms / pathways are provided and the main clinical-decision situations are portrayed. The book is invaluable for all neurorehabilitation team members, clinicians, nurses, and therapists in neurology, physical medicine and rehabilitation, and related fields. It is a World Federation for NeuroRehabilitation (WFNR) educational initiative, bridging the gap between the rapidly expanding clinical research in stroke rehabilitation and clinical practice across societies and continents. It can be used for both clinical decision-making for individuals and as well as clinical background knowledge for stroke rehabilitation service development initiatives.

The Shoulder in Hemiplegia Rene Cailliet 1980 This popular series, by a distinguished professor of physical medicine, has proved helpful to physicians and therapists all over the world. Each book offers sound, common-sense guidance in diagnosing and treating painful and disabling conditions. In every book, the author's lucid text and instructional drawings provide a strong foundation in the basic and functional anatomy of the pain's region. He discusses various painful conditions and shows how each condition is related to the abnormal mechanism causing the pain or disability. Specific and practical suggestions for treatment help to correct or alter the abnormality discovered from the history and physical examination. Details on the individual books follow.

Based on the Bobath concept, Davies' approach to rehabilitation stresses the need to equip the patient for a full life, rather than setting arbitrary goals for functioning in a sheltered environment. Activities are described for correcting abnormal movement patterns and facial difficulties. Ways to regain walking, balance and other normal movement sequences are explained and demonstrated with 750 photographs of patients being treated.
